EG 2012 Tutorial: Polygon Mesh Repairing - 14.05.2012

2

Motivation

- demand for digital 3D models is ubiquitous

- CAD / CAM
- Simulation
- Gaming
- Cultural heritage
- Medicine
- Bioinformatics

EG 2012 Tutorial: Polygon Mesh Repairing - 14.05.2012

3

Motivation

- depending on the application, 3D models need to be:
 - visualized
 - analyzed
 - processed
 - converted
- advanced algorithms in these contexts often have strict requirements on model quality and integrity

EG 2012 Tutorial: Polygon Mesh Repairing - 14.05.2012

4

Motivation

- polygon meshes are a de facto standard in numerous domains
 - extremely flexible and descriptive
 - supported by hardware acceleration
- their versatility, at the same time, allows for a variety of defects and flaws in the representation

Motivation

EG 2012 Tutorial: Polygon Mesh Repairing - 14.05.2012

5

EG 2012 Tutorial: Polygon Mesh Repairing - 14.05.2012

6

Motivation

EG 2012 Tutorial: Polygon Mesh Repairing - 14.05.2012

7

Motivation

- *real world* meshes often contain various defects, depending on their origin.
- but many applications assume *ideal* meshes free from defects or flaws.
- **Mesh Repairing** adapts raw mesh models to specific application requirements.

- complexity of the repair task is often underestimated by non-experts

EG 2012 Tutorial: Polygon Mesh Repairing - 14.05.2012

18

Motivation

- complexity of the repair task is often underestimated by non-experts
 - big difference between „looks good“ and „is good“
 - reliable handling of all degenerate cases is challenging to implement
 - most repair algorithms focus on certain defect types and ignore or even introduce others

23

The Mesh Repair Problem

- given: input mesh / polygon soup M
- find: output mesh M'
 - globally consistent manifold / solid "watertight"
 - tolerance: $\text{dist}(M, M') < \text{epsilon}$

EG 2012 Tutorial: Polygon Mesh Repairing - 14.05.2012

24

Tolerances

- $\text{dist}(p,q) = \|p - q\|$

Tolerances

- $\text{dist}(p,q) = \|p - q\|$
- $\text{dist}(p,S) = \min \{ \text{dist}(p,q) \mid \forall q \in S \}$

Tolerances

- $\text{dist}(p,q) = \|p - q\|$
- $\text{dist}(p,S) = \min \{ \text{dist}(p,q) \mid \forall q \in S \}$
- $\text{dist}(S,S') = \max \{ \text{dist}(p,S') \mid \forall p \in S \}$

Tolerances

- $\text{dist}(p,q) = \|p - q\|$
- $\text{dist}(p,S) = \min \{ \text{dist}(p,q) \mid \forall q \in S \}$
- $\text{dist}(S,S') = \max \{ \text{dist}(p,S') \mid \forall p \in S \}$

Tolerances

- $\text{dist}(p,q) = \|p - q\|$
- $\text{dist}(p,S) = \min \{ \text{dist}(p,q) \mid \forall q \in S \}$
- $\text{dist}(S,S') = \max \{ \text{dist}(p,S') \mid \forall p \in S \}$
- $\text{dist}(S,S') \neq \text{dist}(S',S)$
- **Hausdorff** distance:
 $\max \{ \text{dist}(S,S'), \text{dist}(S',S) \}$

The Mesh Repair Problem

- given: input mesh / polygon soup M
- find: output mesh M'
 - globally consistent manifold / solid "watertight"
 - tolerance: $\text{dist}(M,M') < \text{epsilon}$

The Mesh Repair Problem

- given: input mesh / polygon soup M
- find: output mesh M'
 - globally consistent manifold / solid "watertight"
 - tolerance: $\text{dist}(M, M') < \epsilon$
 $\text{dist}(M', M) < \delta$
 $\text{dist}(M', M) > \epsilon$ only at ∂M

EG 2012 Tutorial: Polygon Mesh Repairing - 14.05.2012

31

EG 2012 Tutorial: Polygon Mesh Repairing - 14.05.2012

42

The Mesh Repair Problem

- the *general* mesh repair problem is genuinely **ill-posed**
 - inherent ambiguities (topological & geometrical)
- domain knowledge
- heuristics
- interactive user input
- all these are application specific ...

EG 2012 Tutorial: Polygon Mesh Repairing - 14.05.2012

43

The Application Perspective

- *the* optimal mesh repair method does not (yet) exist
 - each has advantages and disadvantages
 - some defects are repaired, others introduced
 - the input needs to meet certain requirements
 - only certain (limited) guarantees about the output are provided
- hence, application context needs to be considered to make the best trade-off.

EG 2012 Tutorial: Polygon Mesh Repairing - 14.05.2012

EG 2012 Tutorial: Polygon Mesh Repairing - 14.05.2012

48

The Application Perspective

EG 2012 Tutorial: Polygon Mesh Repairing - 14.05.2012

49

The Application Perspective

- categorization of:
 - defect types
 - upstream applications / data sources
 - based on typical defects of output meshes.
 - downstream applications
 - based on typical requirements on input meshes.
- repair approaches
 - along with specific requirements and guarantees

EG 2012 Tutorial: Polygon Mesh Repairing - 14.05.2012

50

The Application Perspective

- based on these criteria and by looking at the combinatorics of
 - upstream application
 - repair algorithm
 - downstream application

guidelines can be derived to find methods well-suited for a specific problem setting

EG 2012 Tutorial: Polygon Mesh Repairing - 14.05.2012

51

Mesh Repair Recipe

1. what is the upstream application?
 - determines characteristics and defects of M
2. what is the downstream application?
 - determines requirements on M'
3. is it actually necessary to repair M?
 4. does there exist a suitable algorithm?
 5. can several methods be combined?
6. otherwise:
 - there is a gap in the state of the art ...

EG 2012 Tutorial: Polygon Mesh Repairing - 14.05.2012

52

Tutorial Outline

- defect types
- upstream applications
- downstream applications
- repair approaches
 - local \Leftrightarrow global
 - mesh-based \Leftrightarrow volumetric
 - geometrical \Leftrightarrow topological
- repair workflows – an example
- discussion & open problems

EG 2012 Tutorial: Polygon Mesh Repairing - 14.05.2012

53

DEFECT TYPES

- We distinguish issues about:
 - Local connectivity
 - „The set of polygons does not represent a combinatorially manifold simplicial complex“
 - Global topology
 - „The overall topological structure (number of components, genus, orientability) is wrong“
 - Geometry
 - „The geometric realization is flawed (holes, gaps, noise, ...)“

EG 2012 Tutorial: Polygon Mesh Repairing - 14.05.2012

54

DEFECT TYPES

- Local connectivity
 - Isolated vertices
 - „A vertex that is not incident to any edge“
 - Dangling edges
 - „Edges without any incident triangles“
 - Singular edges
 - „Edges with more than two incident triangles“
 - Singular vertices
 - „Vertices with a non-disc neighborhood“

EG 2012 Tutorial: Polygon Mesh Repairing - 14.05.2012

55

DEFECT TYPES

- Global topology
 - Topological noise
 - „Tiny spurious handles or tunnels“
 - „Tiny disconnected components“
 - „Unwanted cavities“
 - Orientation
 - „Incoherently oriented faces“

EG 2012 Tutorial: Polygon Mesh Repairing - 14.05.2012

56

DEFECT TYPES

EG 2012 Tutorial: Polygon Mesh Repairing - 14.05.2012

57

DEFECT TYPES

EG 2012 Tutorial: Polygon Mesh Repairing - 14.05.2012

58

DEFECT TYPES

- Global topology
 - Topological noise
 - „Tiny spurious handles or tunnels“
 - „Tiny disconnected components“
 - „Unwanted cavities“
 - Orientation
 - „Incoherently oriented faces“

EG 2012 Tutorial: Polygon Mesh Repairing - 14.05.2012

59

DEFECT TYPES

- Geometry
 - Holes
 - „Missing pieces within a surface“
 - e.g. due to occlusions during capturing
 - Gaps
 - „Missing pieces between surfaces“
 - e.g. due to inconsistent tessellation routines
 - Cracks / T-Junctions
 - Inherently ill-posed
 - Plausible geometry needs to be conceived

EG 2012 Tutorial: Polygon Mesh Repairing - 14.05.2012

60

DEFECT TYPES

- Geometry
 - Degenerate elements
 - „Triangles with (near-)zero area“
 - Self-intersections
 - „Non-manifold geometric realization“
 - Sharp feature chamfering
 - „Aliasing artifacts due to sampling pattern“
 - Data noise
 - „Additive noise due to measurement imprecision“

DEFECT TYPES

- Geometry
 - Besides the absence of (near-)degeneracies, the general element quality is an important characteristic in several applications.
 - Conversion of meshes to meet such „continuous quality criteria“ is the scope of „surface remeshing“.

UPSTREAM APPLICATIONS

- Upstream applications (or *sources*) characterized by:
 - *Nature*
 - (physical) real-world data <-> (virtual) concepts
 - *Approach*
 - ... employed to convert data to polygon mesh
- Both aspects can be the source of defects and flaws.

UPSTREAM APPLICATIONS

- Nature
 - *Designed*
 - Basic concept is an abstraction
 - Problems due to:
 - Inaccuracies in the modeling process
 - Inconsistencies in the description/representation
 - *Digitized*
 - Measurement of real-world phenomenon
 - Problems due to:
 - Measurement inaccuracies
 - Measurement limitations

UPSTREAM APPLICATIONS

Nature	noise	holes	gaps	intersections	degeneracies	singularities	topolog. noise	aliasing
Digitized (physical)	X	X					X	X
Designed (virtual)			X	X	x	X		

UPSTREAM APPLICATIONS

- Approach
 - *Tessellation*
 - *Depth image fusion*
 - *Raster data contouring*
 - *Implicit function contouring*
 - *Reconstruction from points*
 - *Height field triangulation*
 - *Solid model boundary extraction*

UPSTREAM APPLICATIONS

- Tessellation
 - *Gaps, Intersections*
 - *due to deviation from original curved surface*
 - *(Degeneracies)*
 - *depending on special case handling in tessellator*

EG 2012 Tutorial: Polygon Mesh Repairing - 14.05.2012

67

UPSTREAM APPLICATIONS

- Depth image fusion
 - *Intersections*
 - *(Degeneracies, Singularities)*
 - *e.g. when using the popular Minolta V910 software*

from [Turk and Levoy 1994]

EG 2012 Tutorial: Polygon Mesh Repairing - 14.05.2012

68

UPSTREAM APPLICATIONS

- Raster data contouring
 - *Singularities*
 - *due to ambiguous configurations*
 - *(Degeneracies)*
 - *If fixed pattern used*

Image by Andreas Baerentzen

EG 2012 Tutorial: Polygon Mesh Repairing - 14.05.2012

69

UPSTREAM APPLICATIONS

- Implicit function contouring
 - *Aliasing*
 - *(Topological noise) – if fixed pattern used*

EG 2012 Tutorial: Polygon Mesh Repairing - 14.05.2012

70

UPSTREAM APPLICATIONS

- Reconstruction from points
 - Methods available that do not introduce artifacts not already present in the data.
 - But many others might introduce
 - *(Holes)*
 - *(Gaps)*
 - *(Aliasing)*
 - *(Topological noise)*
 - *Even if certain sampling criteria are met that would allow for correct reconstruction in theory*

EG 2012 Tutorial: Polygon Mesh Repairing - 14.05.2012

71

UPSTREAM APPLICATIONS

- Height field triangulation

EG 2012 Tutorial: Polygon Mesh Repairing - 14.05.2012

72

UPSTREAM APPLICATIONS

- Solid model boundary extraction
 - Singularities

EG 2012 Tutorial: Polygon Mesh Repairing - 14.05.2012

73

UPSTREAM APPLICATIONS

Approach	noise	holes	gaps	intersections	degeneracies	singularities	topolog. noise	aliasing
Tessellation			X	X	x			
Depth image fusion				X	x	x		
Raster data contouring					x	X		
Implicit function contouring					x		x	X
Reconstruction from points		x	x				x	x
Height field triangulation								
Solid model boundary extract.						X		

EG 2012 Tutorial: Polygon Mesh Repairing - 14.05.2012

74

DOWNSTREAM APPLICATIONS

- We consider prototypical requirements of a sample of the wide application spectrum
 - *Visualization*
 - *Modeling*
 - *Rapid Prototyping*
 - *Processing*
 - *Simulation*

EG 2012 Tutorial: Polygon Mesh Repairing - 14.05.2012

75

DOWNSTREAM APPLICATIONS

Application Group	noise	holes	gaps	intersections	degeneracies	singularities	topolog. noise	aliasing
Visualization	x	X	x					x
Modeling		X	X		X	x	x	
Rapid Prototyping		X	X	X		X		
Processing	X	X	X	x	X	X	x	x
Simulation	X	X	X	X	X	X	X	x

EG 2012 Tutorial: Polygon Mesh Repairing - 14.05.2012

76

REPAIR APPROACHES

- We distinguish between two types:
 - Local:
 - Handling defects individually by local modifications.
 - Low invasiveness, but only few guarantees.
 - Global:
 - Typically based on a complete remeshing.
 - High robustness, but often loss of detail.
 - More plausible ambiguity resolution possible.

EG 2012 Tutorial: Polygon Mesh Repairing - 14.05.2012

77

LOCAL APPROACHES

Gap closing

EG 2012 Tutorial: Polygon Mesh Repairing - 14.05.2012

78

Gaps – Nature and origin

- Between connected components of a mesh; made of separated chains of edges
- Produced by tessellation, round-off, conversion errors, inaccurate trimming, ...
- Usually long and narrow
- Most methods match gap boundaries by considering their spatial proximity

EG 2012 Tutorial: Polygon Mesh Repairing - 14.05.2012

79

Proximity-based approaches

- Merge vertices within a prescribed distance [RW92]
 - to re-unite displaced but equivalent vertices.

EG 2012 Tutorial: Polygon Mesh Repairing - 14.05.2012

80

Proximity-based approaches

- Merge vertices within a prescribed distance [RW92]
 - to re-unite displaced but equivalent vertices.

96

Proximity-based approaches

- Progressively "zip" pairs of boundary edge chains [SM95], [BK97]
 - Better control over topology.

"Stitching"

Proximity-based approaches

- Progressively "zip" pairs of boundary edge chains [SM95], [BK97]
 - Better control over topology.

"Stitching"

Proximity-based approaches

- Progressively "zip" pairs of boundary edge chains [SM95], [BK97]
 - Better control over topology.
 - Start from closest pairs to resolve ambiguities.

Proximity-based approaches

- Progressively "zip" pairs of boundary edge chains [SM95], [BK97]
 - Better control over topology.
 - Start from closest pairs to resolve ambiguities.

Proximity-based approaches

- Progressively "zip" pairs of boundary edge chains [SM95], [BK97]
 - Better control over topology.
 - Start from closest pairs to resolve ambiguities.

Proximity-based approaches

- Progressively "zip" pairs of boundary edge chains [SM95], [BK97]
 - Better control over topology.
 - Start from closest pairs to resolve ambiguities.

Proximity-based approaches

- Progressively "zip" pairs of boundary edge chains [SM95], [BK97]
 - Better control over topology.
 - Start from closest pairs to resolve ambiguities.

EG 2012 Tutorial: Polygon Mesh Repairing - 14.05.2012

103

Proximity-based approaches

- Progressively "zip" pairs of boundary edge chains [SM95], [BK97]
 - Better control over topology.
 - Start from closest pairs to resolve ambiguities.

EG 2012 Tutorial: Polygon Mesh Repairing - 14.05.2012

104

Proximity-based approaches

- Progressively "zip" pairs of boundary edge chains [SM95], [BK97]
 - Better control over topology.
 - Start from closest pairs to resolve ambiguities.

EG 2012 Tutorial: Polygon Mesh Repairing - 14.05.2012

105

Advanced Gap Closing

- Several gaps may cross and meet
 - globally optimal matching of (parts of) boundary curves [BS95] instead of greedy

EG 2012 Tutorial: Polygon Mesh Repairing - 14.05.2012

106

Negative Gaps

- Consider also "negative gaps", i.e. overlapping patches, by clipping and merging [TL94]

EG 2012 Tutorial: Polygon Mesh Repairing - 14.05.2012

107

Negative Gaps

- Consider also "negative gaps", i.e. overlapping patches, by clipping and merging [TL94]

EG 2012 Tutorial: Polygon Mesh Repairing - 14.05.2012

108

Negative Gaps

- Consider also "negative gaps", i.e. overlapping patches, by clipping and merging [TL94]

- general problem for „stitching“
- problem for „zippering“ if overlap larger than triangles

Negative Gaps

- Consider also "negative gaps", i.e. overlapping patches, by clipping and merging [TL94]

Issues of pairwise boundary stitching

- pairwise processing does not introduce singular edges
- some gaps remain when only reasonably resolvable into a non-manifold mesh
- Thus, some methods allow to produce non-manifolds to be able to close all the gaps [BNK02]
- Dynamic selection of zipping or stitching depending on gap width [PMR05]

Advanced Gap Closing

- Gaps may not be bounded by boundary edges
 - More general detection and resolution needed
 - Hybrid approach [BK05]
 - Remeshing in voxels surrounding the gaps
 - Output guaranteed intersection-free

Summary Table – Gap Closing

Algorithm	Input requirements	Parameters	Potential new flaws
[Rock and Wozny 1992]	Very small gaps	Gap width	Intersections, degen., singularities
[Sheng and Meier 1995]	-	Gap width	Intersections, degen.
[Barequet and Kumar 1997]	-	Gap width	Intersections, degen.
[Turk and Levoy 1994]	Overlap	Gap threshold	Intersections, degen.
[Borodin et al. 2002]	-	-	Intersections, degen., singularities
[Patel et al. 2005]	-	-	Intersections, degen., singularities
[Bischoff and Kobbelt 2005]	-	Gap width, resolution	Degeneracies

LOCAL APPROACHES Hole Filling

Hole Filling

- Early methods detect holes by looking for closed loops of boundary edges
- These "simple" holes can be patched by triangulating their boundary loops

EG 2012 Tutorial: Polygon Mesh Repairing - 14.05.2012

115

3D Polygon Triangulation

- Heuristics:
 - Minimal area, minimal dihedral angles
- Greedy triangulation [BW92; MD93; VPK05; RW97]
- Find optimum by Dynamic Programming [BS95; Lie03]
- Too coarse for large holes
- Some 3D polygons cannot be triangulated without self-intersections

EG 2012 Tutorial: Polygon Mesh Repairing - 14.05.2012

116

Beyond Triangulation

- For large holes, insert additional vertices within the triangulation while trying to:
 - meet Delaunay criterion [PS96]
 - reproduce the sampling density and achieve normal continuity [Lie03]
 - consider internal angles, dihedral angles, and areas [WWP10]
- Dynamic programming rather inefficient for very large holes (e.g. in high-res scans)

EG 2012 Tutorial: Polygon Mesh Repairing - 14.05.2012

117

Beyond Triangulation

EG 2012 Tutorial: Polygon Mesh Repairing - 14.05.2012

118

Beyond Triangulation

EG 2012 Tutorial: Polygon Mesh Repairing - 14.05.2012

119

Beyond Triangulation

- For large holes, insert additional vertices within the triangulation while trying to:
 - meet Delaunay criterion [PS96]
 - reproduce the sampling density and achieve normal continuity [Lie03]
 - consider internal angles, dihedral angles, and areas [WWP10]
- Dynamic programming rather inefficient for very large holes (e.g. in high-res scans)

EG 2012 Tutorial: Polygon Mesh Repairing - 14.05.2012

120

Other approaches

- Advancing front with Poisson equation [ZGL07]
- Radial Basis Functions [BPB06]
- NURBS fitting [KSI*07]
- Curvature energy minimization [Lev03; PMV06]
- Moving Least Squares projection [WO07; TC04]
- Often robustness issues due to required boundary region parameterizations, hole boundary flattenings, control point setup, etc.

EG 2012 Tutorial: Polygon Mesh Repairing - 14.05.2012

121

Self-intersections

- When additional vertices are inserted, methods may try to create intersection-free patches
 - [TC04] – After each triangle insertion check for intersections. Might fail in producing the complete patch.
 - [WLG03] – Randomized optimization by simulated annealing. Less failures, but still no guaranteed convergence to any plausible result.

EG 2012 Tutorial: Polygon Mesh Repairing - 14.05.2012

122

Issues

- Potentially new intersections
- Holes might have complex topologies
 - The algorithms cited consider one loop at a time. Not suitable for e.g. holes with "islands"

EG 2012 Tutorial: Polygon Mesh Repairing - 14.05.2012

EG 2012 Tutorial: Polygon Mesh Repairing - 14.05.2012

128

Exploit the volume

- Build a Constrained Delaunay Tetrahedralization
 - Input required to be free of self-intersections, singularities and degeneracies
- Using graph-cut techniques, proper facets of tetrahedra are selected to fill holes with multiple boundaries [PR05]
- Guarantee: intersection-free output

EG 2012 Tutorial: Polygon Mesh Repairing - 14.05.2012

129

Summary Table – Hole Filling

Algorithm	Input requirements	Parameters	Intersect.-free
[Bøhn and Wozny 1992]	-	-	
[Mäkelä and Dolenc 1993]	-	-	
[Roth and Wibowoo 1997]	Roughly planar hole boundaries	-

130

LOCAL APPROACHES Mesh Completion

Beyond smooth patches

- Reproducing morphological details can lead to more plausible patches
- *Mesh completion* algorithms attempt to solve this problem
- Copy structure, texture, and features from intact parts

from [Sharf et al. 2004]

EG 2012 Tutorial: Polygon Mesh Repairing - 14.05.2012

131

EG 2012 Tutorial: Polygon Mesh Repairing - 14.05.2012

132

Types of completion algorithms

- Mainly two classes:
 - Modification of template shapes
 - Use available geometry to select a proper "template" from a DB and adapt the latter
 - Creation of the missing geometry
 - Use available geometry to create detailed patches that complete the missing parts

EG 2012 Tutorial: Polygon Mesh Repairing - 14.05.2012

133

Template-based completion

- Often require user suggestions to start the alignment, e.g. correspondences, feature markers, ...
- Useful just for objects that can be clearly classified into one of few categories
 - human head scans [BV99; KHYS02; BMVS04]
 - bodies [ACP03; ASK*05]
 - teeth [KHYS02; SK02]

EG 2012 Tutorial: Polygon Mesh Repairing - 14.05.2012

134

Template-based completion

Image courtesy of Kraevoy and Sheffer

EG 2012 Tutorial: Polygon Mesh Repairing - 14.05.2012

135

Inter vs Intra-shape similarities

- The necessary patches can be
 - copied from other parts of the same model [SACO04]
 - Useful if textures and features shall be replicated
 - synthesized according to the geometry of a set of meshes of the same class as the input [PMG*05]
 - To achieve correct global structure and topology

EG 2012 Tutorial: Polygon Mesh Repairing - 14.05.2012

136

Patch-based Completion

- Shape similarity measure
 - To find best region or patch to copy into hole region.
- Selection strategy:
 - Evaluate for a set of discrete locations/orientations/scales [SACO04]
 - Evaluate on a per point basis [BSK05; BF05]

from [Sharf et al. 2004]

EG 2012 Tutorial: Polygon Mesh Repairing - 14.05.2012

137

Photo-based Completion

- Infer information from additional photos
 - Shape-from-shading technique [XGR*06]
 - Photo-consistency measure [BWS*10]

from [Xu et al. 2006]

EG 2012 Tutorial: Polygon Mesh Repairing - 14.05.2012

138

Creation of missing geometry

- Patches can be easily copied, but it's hard to merge them continuously with mesh
- Many algorithms work on point-based representations instead [SACO04; BSK05; BF05; PGSQ06; XZM*07]
 - Need to appropriately sample if input is mesh
 - Need to triangulate the resulting patches

EG 2012 Tutorial: Polygon Mesh Repairing - 14.05.2012

139

Summary Table – Mesh Completion

Algorithm	Input requirements	Parameters	Potential new flaws
[Sharf et al. 2004]	- (point-based)	Resolution	(topo. noise, alias.)
[Bendels et al. 2005]	- (point-based)	Scale levels	(topo. noise, alias.)
[Breckon and Fisher 2005]	- (point-based)	Window Size	(topo. noise, alias.)
[Park et al. 2006]	- (point-based)	Resolution	(topo. noise, alias.)
[Xiao et al. 2005]	- (point-based)	Several ...	(topo. noise, alias.)
[Pauly et al. 2005]	-	Model database, keywords	Degeneracies, intersections
[Xu et al. 2006]	Roughly planar hole boundaries	Calibrated images	Degeneracies, intersections

EG 2012 Tutorial: Polygon Mesh Repairing - 14.05.2012

140

LOCAL APPROACHES Degeneracy and Self-Intersection Removal

EG 2012 Tutorial: Polygon Mesh Repairing - 14.05.2012

141

Types of input

- Degeneracies (or near-degeneracies) are often the source of instabilities
- Algorithms that fix them might need to use robust geometric predicates
- Two types of input
 - Tessellated CAD models
 - Digitized models

EG 2012 Tutorial: Polygon Mesh Repairing - 14.05.2012

142

Slicing CAD models

- Needle-like triangles are simply removed by collapsing the edge opposite to the degenerate corner
- Caps can be split into needles
 - To avoid loops, [BK01] employ a slicing technique
- When done, iterative edge collapses can simplify the model while removing all the needles

EG 2012 Tutorial: Polygon Mesh Repairing - 14.05.2012

143

Slicing technique [BK01]

EG 2012 Tutorial: Polygon Mesh Repairing - 14.05.2012

144

Treating raw digitized meshes

- Here we can count on a rather uniform and dense sampling [Att10]
- Needles can still be removed by collapsing the opposite edge
- Caps can be resolved by "swapping" the edge opposite to the flat corner
- Guaranteed to converge for exact degeneracies, not for near-degeneracies

EG 2012 Tutorial: Polygon Mesh Repairing - 14.05.2012

145

Manifold meshes

- Keeping the mesh manifold while removing the needles might be impossible for non-exact degeneracies
- E.g. a long and thin cylinder might be tessellated with only triangles with angles below the given threshold

EG 2012 Tutorial: Polygon Mesh Repairing - 14.05.2012

146

Self-intersections

- Two problems
 - Detection
 - Resolution
- All-with-all intersection tests lead to quadratic complexity → unaffordable
- Need spatial subdivision to reduce the search space

EG 2012 Tutorial: Polygon Mesh Repairing - 14.05.2012

147

Local remeshing

- [BK05] use a voxel grid to locate self-intersections efficiently
- If a voxel contains intersecting triangles, the surface within the voxel is remeshed
- Same process to locate and fix small gaps
- Modifications occur only near the flaws, thus the approach is local
- Useful to fix tessellated CAD patches with approximated trimming curves

EG 2012 Tutorial: Polygon Mesh Repairing - 14.05.2012

148

Removing triangles

- In digitized meshes intersecting triangles are small and can be simply removed, and the resulting holes filled
- Approach used in [Att10], where several repairing tasks are performed in sequence
- No parameters are necessary

EG 2012 Tutorial: Polygon Mesh Repairing - 14.05.2012

149

Robustness issues

- Finite precision may be insufficient to represent the intersection points
- [CK10] use an intermediate BSP representation
 - Fast and robust
- [GHH*03] use arbitrary precision arithmetic
 - More precise
 - Slower; requires more resources

EG 2012 Tutorial: Polygon Mesh Repairing - 14.05.2012

150

Summary Table – Degeneracy and Self-Intersection Removal

Algorithm	fixes:	Input requirements	Parameters	GS	Accuracy
[Botsch and Kobbelt 2001]	D	manifold	Thr. angle		approx.
[Attene 2010]	D, S, H	-	Thr. angle		approx.
[Bischoff and Kobbelt 2005]	S, G	manifold	Tolerance, gap width	X	approx.
[Campen and Kobbelt 2010]	S	no boundary, no degeneracies	-	X	exact
[Granados et al. 2003]	S	-	-	X	exact

D = degenerate faces
S = self-intersections
H = holes
G = gaps

GS = guaranteed success

EG 2012 Tutorial: Polygon Mesh Repairing - 14.05.2012

151

Interactive approach

- In [KB03], for each corrupted sharp edge, the user draws a “fishbone” structure (spine and orthogonal ribs)
- A tessellation of this structure replaces the original chamfer with a sharp patch
- Useful also to model arbitrary profiles to be swept along the edge

EG 2012 Tutorial: Polygon Mesh Repairing - 14.05.2012

153

Other automatic approaches

- In their hole-filling algorithm [CC08] include a sharpness-dependent filter to reconstruct features
- In [Wan06] both sharp features and smooth blends between smooth regions are reconstructed
 - To differentiate between these two cases, the user is required to specify a parameter

EG 2012 Tutorial: Polygon Mesh Repairing - 14.05.2012

155

LOCAL APPROACHES Sharp Feature Restoration

EG 2012 Tutorial: Polygon Mesh Repairing - 14.05.2012

152

The EdgeSharpener approach

- Detect smooth regions by analyzing the dihedral angle at mesh edges [AFRS05]
- Create sharp features as intersections of planar extrapolations of smooth regions
- Suitable for meshes interpolating points of feature-insensitive sampling patterns
- Automatic

EG 2012 Tutorial: Polygon Mesh Repairing - 14.05.2012

154

Newly-introduced flaws

- All the methods discussed “add” or “remove” material” to reconstruct the features → potential self-intersections
- The EdgeSharpener method might produce degenerate triangles while splitting the chamfers

EG 2012 Tutorial: Polygon Mesh Repairing - 14.05.2012

156

Summary Table – Sharp Features

Algorithm	Input requirements	Parameters	Potential new flaws
[Kobbelt and Botsch 2003]	manifold	interactive	self-intersections
[Attene et al. 2005]	manifold, no degeneracies	-	self-intersections, degeneracies
[Chen and Cheng 2008]	manifold, no degeneracies	-	self-intersections
[Wang 2006]	no noise, no degeneracies	two thresholds	self-intersections

EG 2012 Tutorial: Polygon Mesh Repairing - 14.05.2012

157

Laplacian smoothing

- Iterative algorithm
- For each iteration, compute the eventual position of each vertex as the center of mass of the neighbors
- Tends to “shrink” the shape

EG 2012 Tutorial: Polygon Mesh Repairing - 14.05.2012

159

Morphology-aware denoising

- Previous algorithms smooth everything
- If morphological features are important, [FDCO03] propose to use a bilateral filter as done in image processing
 - User need to set two parameters
- [JDD03] propose an alternative approach which is non-iterative
 - Can treat polygon soups as well

EG 2012 Tutorial: Polygon Mesh Repairing - 14.05.2012

161

LOCAL APPROACHES Mesh Denoising

EG 2012 Tutorial: Polygon Mesh Repairing - 14.05.2012

158

Non-shrinking methods

- λ/μ algorithm [Tau95] - a modification of the Laplacian smoothing
- For each iteration, two sub-iterations are performed
 - One inward diffusion, controlled by λ
 - One outward diffusion, controlled by μ
- Alternatively, [VMM99] push vertices toward original surface after each Laplacian iteration

EG 2012 Tutorial: Polygon Mesh Repairing - 14.05.2012

160

Denoising and sharpening

- In both [HP04] and [SRML07], smooth regions are denoised while potential sharp edges are actually sharpened
- For the case of mechanical/man-made objects, [FYP10] propose a specific approach that is more accurate

EG 2012 Tutorial: Polygon Mesh Repairing - 14.05.2012

162

Newly introduced flaws

- All the described methods move vertices to new positions
- Some of them reconstruct sharp features, thus add material to the object
- Typically, no controls are performed to check that these modifications do not produce self-intersections or degeneracies

EG 2012 Tutorial: Polygon Mesh Repairing - 14.05.2012

163

Summary table - Denoising

Algorithm	Properties	Input requirements	Parameters
[Taubin 1995]	N	closed manifold	λ, μ, n
[Fleishman et al. 2003]	N, F	manifold	σ_c, σ_s, n
[Jones et al. 2003]	N, F	-	σ_{noise}
[Hildebrandt and Polthier 2004]	N, S	manifold	λ, r
[Fan et al. 2010]	N, S	manifold	-n

N = noise removal
 F = feature preservation
 S = feature sharpening

All these methods might introduce degeneracies and self-intersections

EG 2012 Tutorial: Polygon Mesh Repairing - 14.05.2012

164

LOCAL APPROACHES Topology Correction

EG 2012 Tutorial: Polygon Mesh Repairing - 14.05.2012

165

Types of approaches

- Based on prior knowledge of the topology
 - e.g. Reconstruction of human cortex from MRI [XPR*02]: known to be genus 0
- Involving user interaction
 - [SLS*07] – Ask the user to resolve possible ambiguities
- Based on threshold parameters
 - [GW04] – Remove all handles smaller than a threshold size

EG 2012 Tutorial: Polygon Mesh Repairing - 14.05.2012

166

Genus-0 surfaces

- [FLD01] inflate the input mesh (brain cortex) by alternating steps of Laplacian smoothing and radial projection (spherical parameteriz.)
- Folds are replaced by disk-like patches, and the parameterization is reversed
- Other methods: [SL01], [HXBNP02] (genus-N)

EG 2012 Tutorial: Polygon Mesh Repairing - 14.05.2012

167

Removing small handles

- [ESV97] roll a sphere of radius α over the mesh and fill up all the regions that are not accessible to the sphere
- This removes tiny handles and tunnels, but also spoils concave edges and is unsuitable for meshes with boundary
- Appears to be extremely difficult to implement; robustness issues may arise

EG 2012 Tutorial: Polygon Mesh Repairing - 14.05.2012

168

Topological Noise Removal

- [GW04] use a wavefront traversal to find if the mesh has local handles or tunnels (user-defined size)
- Non-separating cuts are identified and the mesh is cut and sealed along them
- [AF06] propose an accelerated method for digitized meshes which exploits wavefront splitting points

EG 2012 Tutorial: Polygon Mesh Repairing - 14.05.2012

169

Newly introduced flaws

- All these methods add or remove material
- Typically, no checks are performed that these modifications do not produce self-intersections
- Other algorithms exploit explicit definition of the volume to avoid this problem
 - If you have a mesh, voxelization modifies it everywhere, so these must be considered global approaches

EG 2012 Tutorial: Polygon Mesh Repairing - 14.05.2012

170

Voxel-based topology correction

- [WHDS04] use Reeb graphs to locate handles in voxelized shapes
- If handle is small (measured by short non-separating cycles), volumetric data is processed to remove it
- If model has numerous handles, topology-sensitive carving [SV03] is faster though less precise

EG 2012 Tutorial: Polygon Mesh Repairing - 14.05.2012

171

Voxel-based topology correction (2)

- For huge voxelizations (e.g. 4096^3), [ZJH07] use discrete curve skeletons
- [ZJH07] make it possible to actually edit the topology of an object so as to make it equivalent to that of a given target shape

EG 2012 Tutorial: Polygon Mesh Repairing - 14.05.2012

172

Summary table - topology correction

Algorithm	Input requirem.	Parameters	Potential new flaws
[El-Sana and Varshney 1997]	no boundary	radius	self-intersect., aliasing
[Guskov and Wood 2001]	oriented manifold	threshold	self-intersections
[Fischl et al. 2001]	oriented manifold	($\rightarrow 0$ handles)	self-intersections
[Attene and Falcidieno 2006]	-	threshold	self-intersections
[Shattuk and Leahy 2001]	no large holes	($\rightarrow 0$ handles)	(aliasing)
[Han et al. 2002]	no large holes	($\rightarrow 0$ handles)	(aliasing)
[Szymczak and Vanderhyde 2003]	no large holes	threshold	(aliasing)
[Wood et al. 2004]	no large holes	threshold	(aliasing)
[Zhou et al. 2007]	no large holes	two thresholds	(aliasing)
[Ju et al. 2007]	no large holes	target „shape“	(aliasing)

EG 2012 Tutorial: Polygon Mesh Repairing - 14.05.2012

173

GLOBAL APPROACHES

- Approaches discussed so far are local
 - remove single defects (holes, singularities, self-intersections, ...) mainly individually.
- Absence of individual defects not required for their own sake:
 - part of greater requirement for manifoldness.
- Achieving this by sequential local operations is extremely difficult:
 - new defects can be introduced
 - ambiguities are hard to resolve in a local manner.

EG 2012 Tutorial: Polygon Mesh Repairing - 14.05.2012

174

GLOBAL APPROACHES

- Global repair methods can be advantageous in this regard.
 - consider mutual relation of defects for better ambiguity arbitration.
 - possibly employ intermediate volumetric representation:
 - Guarantees that the result is a manifold surface of some solid.
 - Disadvantage: often complete conversion and remeshing necessary → invasive, loss of detail

EG 2012 Tutorial: Polygon Mesh Repairing - 14.05.2012

175

GLOBAL APPROACHES

- Intermediate volumetric representation
 - the repair task boils down to deciding which parts of the volume are inside and outside.
- We can group the global methods by how this decision is performed and by their input requirements
 - Input without significant gaps and holes
 - Input with normal or orientation information
 - Arbitrary input

EG 2012 Tutorial: Polygon Mesh Repairing - 14.05.2012

176

GLOBAL APPROACHES

- Input without significant gaps and holes
 - Rasterization into voxel grid representation,
 - Determination of inside/outside volume by flood-filling,
 - from given seed points [OSD97]
 - from a point at infinity [ABA02]
 - Reconversion to polygon mesh by contouring.
- Not possible for gaps or holes beyond voxel size.

GLOBAL APPROACHES

- Global Optimization [MF97]
 - Surface-aligned volumetric representation (BSP-based)
 - Determine optimal inside/outside labels for cells such that the output surface maximally conforms with the (partial) input.
 - The geometry of the resulting hole-filling patches is rather random and can be displeasing in case of larger holes.

305

Summary table – global approaches

Algorithm	Input requirem.	Signing method
[Oomes et al. 1997]	no significant holes/gaps	flood-filling
[Andújar et al. 2002]	no significant holes/gaps	flood-filling
[Curless and Levoy 1996]	oriented range meshes	line-of-sight
[Furukawa et al. 2007]	oriented range meshes	line-of-sight/light
[Davis et al. 2002]	oriented	normals + diffusion
[Sagawa and Ikeuchi 2008]	oriented	normals + area minimization
[Nooruddin and Turk 2003]	-	parity counting, ray stabbing
[Ju 2004]	(no significant gaps)	hole patching + parity counting
[Bischoff et al. 2005]	-	morphology + flood-filling
[Hornung and Kobbelt 2006]	-	morphology + graph-cut
[Murali and Funkhouser 1997]	(no significant holes)	global sign optimization

306

REPAIRING WORKFLOWS

An example for raw digitized meshes

EG 2012 Tutorial: Polygon Mesh Repairing - 14.05.2012

307

Raw digitized meshes

- We can assume that:
 - Samples are rather uniformly spaced
 - Model is densely sampled (opposed to sparse tessellated NURBS)
- What is the typical input?
 - An indexed face set, possibly non manifold, self-intersecting, with degenerate faces, holes, topological noise, ...
- How do I fix all these defects?
 - Global approach -> unnecessary distortion also where the model has no defects (defects are sparse!)
 - Filters out sharp features
 - Low distortion requires too many triangles

EG 2012 Tutorial: Polygon Mesh Repairing - 14.05.2012

308

A repairing pipeline

- Sequence of local approaches
- Assumes that the input is a raw digitized mesh
- Creates a valid watertight polyhedral surface
- Works in two successive phases:
 - Topology reconstruction
 - Geometry correction

EG 2012 Tutorial: Polygon Mesh Repairing - 14.05.2012

309

Topology reconstruction: step 1

- Convert the indexed face set to a simplicial complex
 - 1) Triangulate non-triangular facets while loading (only simply connected, but this is normal in raw digitized meshes)
 - 2) Create a (initially empty) list L of edges and, for each triangle $\langle i,j,k \rangle$ insert in L its three bounding edges $\langle i,j \rangle$, $\langle j,k \rangle$ and $\langle k,i \rangle$
 - 3) Sort L lexicographically, i.e. if $e_1 = \langle i,j \rangle$ and $e_2 = \langle k,n \rangle$

$$e_1 \leq e_2 \text{ iff } i < k \text{ OR } (i = k \text{ AND } j \leq n)$$
 - 4) Two triangles are adjacent iff they induce consecutive edges in the sorted list L.

EG 2012 Tutorial: Polygon Mesh Repairing - 14.05.2012

310

Topology reconstruction: step 2

- Convert the simplicial complex to a valid triangle mesh (i.e. manifold and oriented)
 - 1) Run the cut&stitch algorithm (Guezic et al., 2001)
 - Duplicate singular vertices and edges
 - 2) Orient the mesh consistently
 - 1) Select a 'seed' triangle (e.g. the topmost one) and orient it
 - 2) Propagate the orientation to neighboring triangles
 - 3) Cut the mesh at non-consistently oriented pairs of triangles

EG 2012 Tutorial: Polygon Mesh Repairing - 14.05.2012

311

Topology reconstruction: step 3

- Convert the manifold and oriented mesh to a single watertight mesh
 - 1) If the mesh could not be oriented (i.e. cuts were necessary) this phase cannot take place -> failure
 - 2) Otherwise, delete all the smallest connected components and fill the holes using Liepa's algorithm
 - 1) Smallest components are computed by counting their triangles (we assumed that the sampling is rather uniform)
 - 2) Smallest components include possible 'isles'
 - 3) The patches used to fill the holes may intersect other parts of the surface

EG 2012 Tutorial: Polygon Mesh Repairing - 14.05.2012

312

Simplicial Neighborhoods

- For the "geometry correction" phase, we make use of the notion of simplicial neighborhood
- The simplicial neighborhood $N(t)$ is the set of all the simplexes which share at least a vertex with the triangle 't'
 - The i 'th order simplicial neighborhood $N_i(t)$ is defined as $N(N(\dots N(N(t))\dots))$, with 'i' nested levels

EG 2012 Tutorial: Polygon Mesh Repairing - 14.05.2012

313

Geometry correction: step 1

- Remove (nearly) degenerate triangles

Require: A combinatorial manifold \mathcal{M} and an integer threshold $max_iterations$
Ensure: A combinatorial manifold \mathcal{M}' and a status notice (success/failure)

```

1:  $\mathcal{M}' := \mathcal{M}$ 
2: Let  $S$  be the set of all the triangles of  $\mathcal{M}'$ 
3: for  $k = 1$  to  $max\_iterations$  do
4:   Run the swap/collapse algorithm within  $S$ 
5:   Let  $T$  be the set of degeneracies in  $S$  untreatable due to topological constraints
6:   if  $T = \emptyset$  then
7:     terminate with success /*  $\mathcal{M}'$  is degeneracy free */
8:   end if
9:   Let  $R$  be the union of the  $k^{th}$ -order simplicial neighborhoods of the  $t, t \in T$ 
10:  Remove  $R$  from  $\mathcal{M}'$ 
11:  Remove possible disconnected components from  $\mathcal{M}'$ 
12:  Patch the remaining gaps with a new set  $P$  of triangles
13:   $S := P$ 
14: end for

```

EG 2012 Tutorial: Polygon Mesh Repairing - 14.05.2012

314

Geometry correction: step 2

- Remove intersecting triangles

```

1:  $\mathcal{M}' := \mathcal{M}$ 
2: Let  $S$  be the set of all the triangles of  $\mathcal{M}'$ 
3: Let  $G$  be a uniform  $100^3$  voxel grid tightly enclosing  $\mathcal{M}'$ 
4: for  $k = 0$  to  $max\_iterations$  do
5:   Let  $H$  be the set of voxels intersecting at least a triangle of  $S$ 
6:   Check for triangle-triangle intersections within each voxel of  $H$ 
7:   Let  $T$  be the set of intersecting triangles detected above
8:   if  $T = \emptyset$  then
9:     terminate with success /*  $\mathcal{M}'$  is not self-intersecting */
10:  end if
11:  Let  $R$  be the union of the  $k^{th}$ -order simplicial neighborhoods of all  $t \in T$ 
12:  Remove  $R$  from  $\mathcal{M}'$ 
13:  Remove possible disconnected components from  $\mathcal{M}'$ 
14:  Patch the remaining gaps with a new set  $P$  of triangles
15:   $S := P$ 
16: end for

```

EG 2012 Tutorial: Polygon Mesh Repairing - 14.05.2012

315

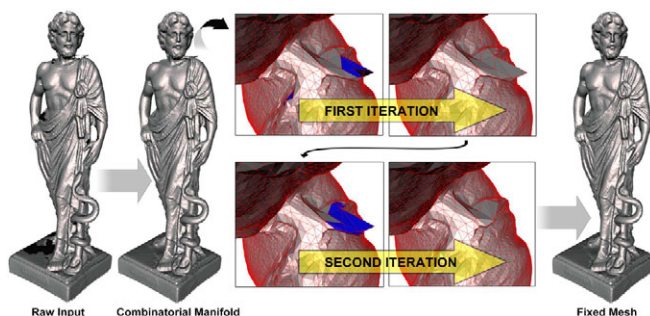

Geometry correction: iteration

- While patching holes to remove self-intersections, new degenerate or nearly degenerate triangles may appear
- So, after step 2 we check for degeneracies and, if any, we repeat steps 1 and 2, until no more degeneracies are left
- This is guaranteed to converge only when exact degeneracies are removed

EG 2012 Tutorial: Polygon Mesh Repairing - 14.05.2012

316

Example

EG 2012 Tutorial: Polygon Mesh Repairing - 14.05.2012

317

"Pathological" cases

- The method is not guaranteed to succeed in all the cases
- We have run it on hundreds of digitized models, it never failed -> good heuristics
- We had to synthesize a specific model to make it fail

EG 2012 Tutorial: Polygon Mesh Repairing - 14.05.2012

318

Applications

- The fixed model can be converted to an explicit solid (i.e. a tetrahedral mesh). This is required e.g. for simulation.

EG 2012 Tutorial: Polygon Mesh Repairing - 14.05.2012

319

DISCUSSION & OUTLOOK

- Widely varying hardness of repair tasks depending on the defects involved.
 - e.g. consistently orienting faces is easily formalized and solved,
 - but filling complex holes or plausibly removing intersections requires a non-trivial approach and intricate case-by-case study due to ambiguities.
- Despite the vast number of existing techniques, there is room for future investigation, especially for the *hard* cases.

EG 2012 Tutorial: Polygon Mesh Repairing - 14.05.2012

320

DISCUSSION & OUTLOOK

- Minimally Invasive, but Guaranteeing and Global
 - Hybrid methods that are as accurate as local methods but ensure correctness like global ones.

EG 2012 Tutorial: Polygon Mesh Repairing - 14.05.2012

321

DISCUSSION & OUTLOOK

- Minimally Invasive, but Guaranteeing and Global
 - Hybrid methods that are as accurate as local methods but ensure correctness like global ones.
- High-Level Interaction incorporating Meta-Knowledge
 - Missing data always implies ill-posedness, automatic heuristics have limits → exploit qualified knowledge of the user through intuitive interaction metaphors.

EG 2012 Tutorial: Polygon Mesh Repairing - 14.05.2012

322

DISCUSSION & OUTLOOK

- Minimally Invasive, but Guaranteeing and Global
 - Hybrid methods that are as accurate as local methods but ensure correctness like global ones.
- High-Level Interaction incorporating Meta-Knowledge

EG 2012 Tutorial: Polygon Mesh Repairing - 14.05.2012

323

DISCUSSION & OUTLOOK

- Minimally Invasive, but Guaranteeing and Global
 - Hybrid methods that are as accurate as local methods but ensure correctness like global ones.
- High-Level Interaction incorporating Meta-Knowledge
 - Missing data always implies ill-posedness, automatic heuristics have limits → exploit qualified knowledge of the user through intuitive interaction metaphors.
- Vertical Integration to Repair Workflows
 - Local methods often treat one defect type → suitable sequencing of methods necessary.

EG 2012 Tutorial: Polygon Mesh Repairing - 14.05.2012
